

# 押し付け動作のみでの把持を実現する トラス構造把持エンドエフェクタの研究

## An end-effector for gripping truss structures requiring only a pushing motion

○ Hiroki NAKANISHI  
Naoki KAWAGUCHI  
Keisuke TAGA  
Tokyo Institute of Technology

Astrodynamics Symposium 2022, July 25

- Background and Purpose
- Design Concept & Development
- Performance evaluation
- Conclusion

# Background

- The number of spacecraft is increasing  
Demand for **On-Orbit Services** is also increasing

Repair and Inspection

Refueling

Space debris removal

- Required technologies for **On-Orbit Services**

Approach

Motion estimation

Capturing & Grasping

- Mechanism design
- End Tip Control
- etc...

The establishment of technology is essential

# Non-cooperative targets

Nakanishi Lab

- Cooperative docking mechanism
  - : 6-DOF constraint mechanism using paired geometries

ETS-VII

Docking Mechanism

SSRMS

Latching End-Effector

Grapple Fixture

## Non-Cooperative:

- Losing control
- No target marker
- No cooperative docking mechanisms

- Targets of On-orbit services : **Non-cooperative**
  - Debris and existing satellites don't have **cooperative docking mechanism**

# Previous research on non-cooperative mechanisms

# Capture targets

- Target parts: Truss structure
  - Trusses are used in various parts of the spacecraft.
  - Geometric constraints of up to 4 DOF for a single cylinder

4-DOF

Our research group is developing **“Low Contact Force grasping Hand (LCFH)”** for cylindrical structures.

# Low Contact Force Grasping Hand

Nakanishi Lab

- Features

- Low contact stiffness and Quick capture

**So, Grasping is possible by pushing away against the cylindrical structure**

- Position and attitude errors can be tolerated.
- Retry motion available
- Electric actuator-less

Retry motion

Approach and capture motion (LCFH-1)

# Each state of the LCFH's grasping claw unit

- Waiting state

: Before contact with target

- Return state

: Return to Waiting state

←  
**Rotate motor**

↓ **Contact**

- Caging state

: Geometrical enclosure around a target

- Fixed state

: High gripping by an actuator

→  
**Rotate motor**

↑ **Reverse motor**

# Movement of Grasping claw unit

## ● Waiting state to Fixed state

1. CDL is held in mechanical singularity by the stopper and spring.
2. Cylinder contacts CDLs and displacement occur.
3. Direction of the torque is reversed and the CDLs are closed.
4. Enclosure possible.
5. The motor drives the linkage and become Fixed state.

CDL: contact detection link

# Movement of Grasping claw unit

## ● Waiting state to Fixed state

1. CDL is held in mechanical singularity by the stopper and spring.
2. Cylinder contacts CDLs and displacement occur.
3. Direction of the torque is reversed and the CDLs are closed.
4. Enclosure possible.
5. The motor drives the linkage and become Fixed state.

Movement of CDL

# Basic Specification

Nakanishi Lab

Size (w/o separate mechanism):  
310mm x 165mm x 50mm

Weight (w/o separate mechanism):  
458g

Required clearance to inaccessible area:  
100mm

Acceleration capacity (before capture motion):  
 $9.8\text{m/s}^2$

Load tolerance (after capture):  
> 110N

# Capture capability

Nakanishi Lab

## Misalignment capability

Target diameter: 30 ~ 60mm

Target Offset:  $\pm 50\text{mm}$ ,  $\pm 5\text{deg}$  (roll, pitch, yaw)

## Initial Contact force

Target diameter: 60mm

Target Offset:  $S_D$  50mm

# Dynamics collation ①

- Purpose: To evaluate the model of the mechanism by experiment and analysis
- Method:
  - Collision of a target in 2D microgravity
  - Calculate the target motion, joint displacement, and force when push away

Microgravity experimental setup

Model in contact with truss

# Dynamics collation ②

## ● Result

Experiments show that the collision model is valid.

# Considerations from Collision experiment

- Purpose: Evaluate the success of the grasping motion with the required work
  - External work is applied that exceeds the elastic energy of the spring

- Elastic energy threshold  $W_s$

$$W_s = \int_0^{2\theta_s} T_s d\theta + D$$

$\theta_s$ : Mounting angle of tension spring

$T_s$ : Torque by tension spring

$D$ : Dissipated energy

- Relative kinetic energy of EE and target  $W_k$

$$W_k \leq \frac{1}{2} m_t (\mathbf{v}_E - \mathbf{v}_t)^T (\mathbf{v}_E - \mathbf{v}_t)$$

$\mathbf{v}_E$ : EE velocity

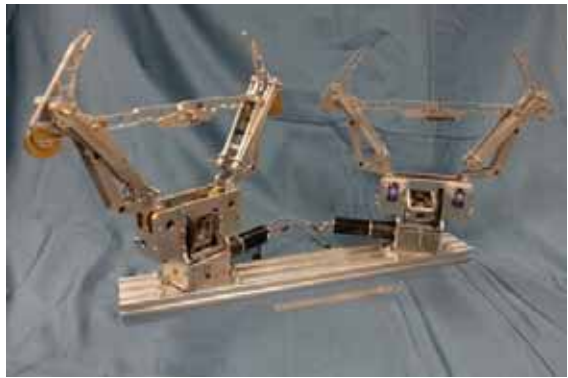

$\mathbf{v}_t$ : Target velocity

$m_t$ : Target mass

Grasp and tighten

Return to initial state

# Concept of LCFH-3

- Target parts: Truss structure
  - Trusses are used in various parts of the spacecraft.
  - Geometric constraints of up to 4 DOF for a single cylinder

4-DOF

# Concept of LCFH-3

- Target parts: Truss structure
  - Trusses are used in various parts of the spacecraft.
  - Geometric constraints of up to 4 DOF for a single cylinder
  - **6-DOF constraint is possible by using a V-shaped intersection**

Design a mechanism to capture V-shaped structures using LCFH

6-DOF constraint is possible with 3 or more constraint points

# Conceptual study of the grasping system

- Proposed grasping method:

2 cylinders of the truss are fixed by symmetrically placed fingers.

Proposed Grasping Method

**it is impossible to use the LCFH as-is for the Grasping module.**

# Grasping module Design Problem

- Problem : Position and attitude error results in different Truss cross-section of Grasping plane

## Target geometric relationship

- Fixing motion of LCFH-1,2 causes relative motion to the truss.
- Fixation must be adapted to the **position and shape** of cross section

**Underactuated grasping** is needed to match the position and shape of the Truss cross-section

# Grasping module Design Problem

- Problem : Position and attitude error results in different Truss cross-section of Grasping plane

- Fixing motion of LCFH-1,2 causes relative motion to the truss.
- Fixation must be adapted to the **position and shape** of cross section

**Adaptive grasping** is needed to match the position and shape of the Truss cross-section

# Design requirements for end-effectors

- Design requirements from robotic satellite systems

Requirement	Design value
Relative position and attitude error tolerance	<ul style="list-style-type: none"><li>● Position error: <math>\pm 10</math> mm</li><li>● Attitude error: <math>\pm 1.0</math> deg</li><li>● <b>Adaptive grasping</b> required</li></ul>
Continuous gripping and fixation	<ul style="list-style-type: none"><li>● when no voltage is applied</li><li>● <b>High gripping force</b> and no back-drivability</li></ul>

Both **Adaptive grasping** and **High gripping force** are required.

# Design of Grasping module

**Grasping module** consists of **Grasping claw unit** and **Driving unit**

## Grasping claw unit

Design based on LCFH

- Low contact stiffness and Quick capture
- Position and attitude errors can be tolerated.
- Retry motion available

## Driving unit

Design in a new way

- Adaptive grasping and High gripping force

# Driving unit configuration

- **Adaptive grasping**

: **Differential gear** makes 1 input into 2 outputs. ( underactuated mechanism )

- **High gripping force**

: Utilizes **Self-locking** of **Worm gear**.

Weight	1.5 kg	3.6 kg

# Movement of Caging to Fixed state

- Method: Grasping the cylinder on the linear guide
- Result:

Y-axis direction offset: 0 mm

Y-axis direction offset: 66 mm

# Movement of Fixed to Waiting state

- Method: Under gravity environment
- Result:

Y-axis direction offset: 0 mm

Y-axis direction offset: 66 mm

# Movement of Waiting to Fixed state

Nakanishi Lab

- Purpose: Concept experiment
- Method: Collision in 2D microgravity
- Result:

# Tolerance region analysis

## ● Result

Position error area

Attitude error area

Axis	Maximum permissible error	Satellite endpoint accuracy
X [mm]	$\pm 27.5$	$\pm 10$
Y [mm]	$\pm 51.5$	$\pm 10$
Z [mm]	$\pm 89.2$	$\pm 10$
Roll [deg]	$\pm 42.5$	$\pm 1.0$
Pitch [deg]	$\pm 8.5$	$\pm 1.0$
Yaw [deg]	$\pm 8.5$	$\pm 1.0$

Satisfy the setting requirement value

Satellite system study can be performed based on the calculated values

# Conclusion

- Proposed method and design requirements for 6-DOF constraint of the truss structure
- Clarified the design method of the grasping mechanism for the truss structure.
- Grasping by pushing away was shown to be possible.
